Formulas Used in Costing Analysis

- $\text{Unit Price} = \text{Bulk Price} / \text{Unit Equivalent (g/ml/pc)}$
- $\text{Ingredient Cost} = \text{Ingredient Amount} * \text{Unit Price}$
- $\text{Total Batch Cost} = \text{Subtotal (Ingredients)} + \text{Total Overhead per Batch}$
- $\text{Cost per Pack} = \text{Total Batch Cost} / 3 \text{ Packs}$
- $\text{Cost per Cookie} = \text{Total Batch Cost} / 18 \text{ Cookies}$
- $\text{Profit} = \text{Selling Price} - \text{Cost}$

Strategic Considerations for your POS System

- **The "Dual-Weight" Logic:** Your system will need to track two different "recipes" for the same flavor if you sell them both as individuals (large, 39g–40g per piece) and in 3-packs (small, 20g per piece). Using the same inventory deduction for both would lead to significant stock discrepancies.
- **Ingredient Branding:** The 2025 files now specify brands (e.g., **Oatside, Dutche, Magnolia**). If you switch brands later, you'll want your system to trigger a "Cost Update" notification since prices vary wildly between suppliers.
- **Missing SKUs:** Since Hojicha and Banana Pudding are missing from these sheets, you may want to create "Placeholder" items in your system so you don't have to rebuild the database structure once those costs are finalized.
